One Probe Simplifies Discovery

Small animal *in vivo* imaging has important significance in biological studies, including human cancer research. The ability to track and visualize a biological probe tagged with an infrared dye *in vivo* yields excellent data for these studies. LI-COR's Odyssey® Infrared Imaging System and IRDye® infrared dyes provide the unique ability to select and use the same probe for every step of the molecular imaging process.

Additional advantages of molecular imaging with IRDye-labeled probes include:

- Low autofluorescence from tissues, plates, cells, biological materials and drug compounds in the near-infrared (NIR).
- IRDye® 800CW absorption/emission near 800 nm matches NIR absorption minima for bodily fluids and tissues.
- Low tissue autofluorescence in the 800 nm region results in excellent depth of tissue penetration (>2 cm).
- High signal-to-noise ratio.

The Odyssey System is a complete solution for *in vitro*, *in vivo*, and tissue section analysis – all on a single platform. Features such as simultaneous two-color detection make it possible for ratiometric analysis *in vitro*, enabling easier and more cost effective tests for probe specificity before *in vivo* imaging. Additional solutions such as the Odyssey MousePOD™ streamline your molecular imaging workflow and make it easier to achieve your research goals.

Molecular Imaging Workflow

Target Identification: *In vivo* imaging projects typically begin with identification of a possible tracking agent or probe, such as a ligand to a receptor or specific antibody.

Label/Conjugation: The probe of choice can be labeled via NHS ester conjugation with IRDye® 800CW infrared dye for imaging on the Odyssey System. Protein labeling kits are available that use IRDye® 800CW NHS ester to label antibodies and proteins. Alternatively, IRDye® 800CW EGF is a labeled targeting agent for use in common human cancers that over-express EGFR.

***In vitro* Assays:** Before starting a costly and time consuming *in vivo* experiment, probe specificity can be determined *in vitro* on the Odyssey System using an immunocytochemical assay performed in microplate format such as the cost effective In-Cell Western (ICW) assay.

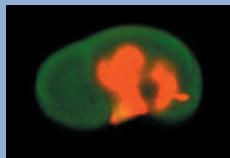

Clearance and Characterization Studies *in vivo*: The labeled targeting agent should be evaluated in “tumor-negative” and “tumor positive” animals. Clearance studies address important questions such as:

Infrared Molecular Imaging using the Odyssey® System

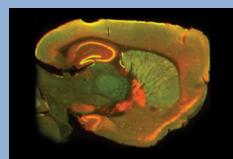

ance and
Studies

Organs

Tissue Sections

- 1) Is the probe retained beyond the intended targets (e.g. liver, kidneys, or bladder)?
- 2) How long does it take for the targeting agent to clear the animal?
- 3) What is the ideal probe concentration?
- 4) When is the best time post-injection to achieve the best signal-to-noise ratio?

Once probe clearance is determined, a full *in vivo* experiment can be performed with greater confidence. Up to three mice can be scanned and the IRDye-labeled probes visualized using the Odyssey System and MousePOD accessory.

Organs: More focused analysis of the probe's localization can be done on the Odyssey by excising and scanning the target organ(s). Scans of organs provide a semi-quantitative estimate of signal and quickly show whether the targeting agent is present.

Tissue Sections: To determine exact tissue localization, frozen or paraffin embedded tissue sections can be scanned on the Odyssey at high resolution. Tissue sections can also be examined using a microscope equipped with an infrared filter.

Products for Molecular Imaging

MousePOD™ Imaging Accessory

- Fits on the Odyssey scanning surface and accommodates up to three mice.
- Delivers gas anesthesia to animals via nose cones (external anesthesia system not included).
- Regulates air temperature to maintain animal's temperature during scanning.
- Includes new Auto Shape tool for Odyssey software to quickly mark tumors, organs, and other regions of interest. Pseudo color display style helps to quickly isolate regions of interest.

MousePOD™ (closed)

IRDye® 800CW Labeling Reagents and Probes

- IRDye® 800CW NHS ester in 0.5 and 5.0 mg pack sizes.
- IRDye® 800CW Labeling Kit for proteins and antibodies. Optimized for 3 conjugations of 1 mg IgG (MW~150,000) or other proteins.
- IRDye® 800CW EGF Optical probe for general, solid-tumor characterization.

IRDye 800CW EGF Optical Probe

Products for Molecular Imaging (continued)

Odyssey® Infrared Imaging System

- Very accurate quantification for Western Blots due to a wide, linear detection range.
- High Sensitivity – equal to or better than chemiluminescence.
- Simultaneous detection in two channels (700 and 800 nm) enables ratiometric analysis in which the one channel is used for normalization.
- Direct infrared detection on membranes eliminates film, darkrooms and messy substrates.
- Wide range of compatible dyes and stains, including LI-COR's IRDyes.
- Familiar software tools for band sizing and quantification. Optional software accessory packages for *in vivo* imaging (included with MousePOD) and In-Cell Western assays (*in vitro* analysis).

Odyssey® Infrared Imaging System

Odyssey® Software Accessory Packages

- In-Cell Western Analysis Software for *in vitro* assays in microplate format. Automatically finds wells for 96- and 384-well microplates, and performs ratiometric calculations using the two imaging channels of the Odyssey System.

Odyssey® Applications

- Quantitative Western blots
- Coomassie® stained gels
- Cell-based assays
- Fluorescent gel-shift assays
- Tissue imaging
- *In vivo* Imaging
- Protein Arrays
